

Version 2.3 (0.1.3) of tnet is now complete!

Last Updated Thursday, 25 February 2010

Version 0.1.3 has the following new functions:

- `small_world_test_w`: calculating observed and random values of a weighted network
- `small_world_test_tm`: calculating observed and random values of a two-mode network

It also includes improved versions of the following functions:

- `weighted_richclub_w`: this function now outputs results in logarithmic bins
- `as.tnet`: this function now checks whether a weighted edgelist is likely to be undirected, but is not duplicated (i.e., are all $i < j$ or all $i > j$)
